Design Critique

Use Case Starter

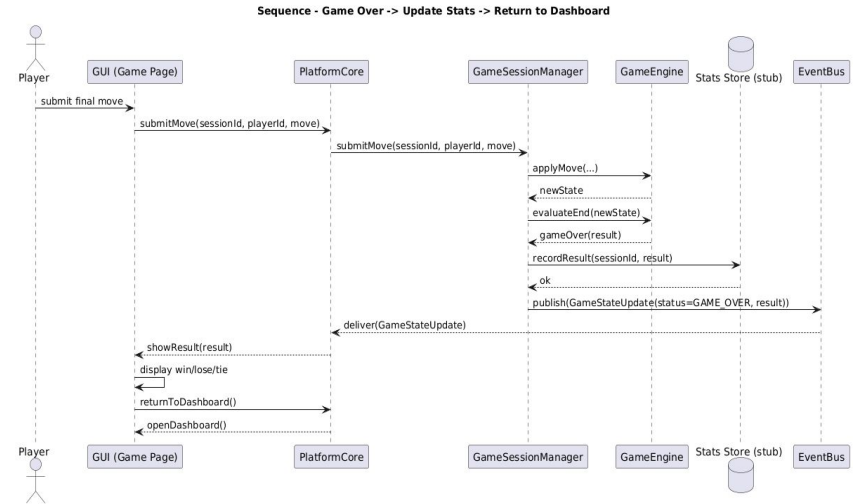

The diagram that we were provided with seems to combine the game registry with many other things, such as create account and log in, both things that the game registry is not primarily responsible for.

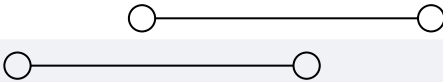

Sequence Starter

There was also no sequence diagram that we found aligned with our goals. Thus, we decided to move forward with making our own sequence diagrams, based on the examples given.

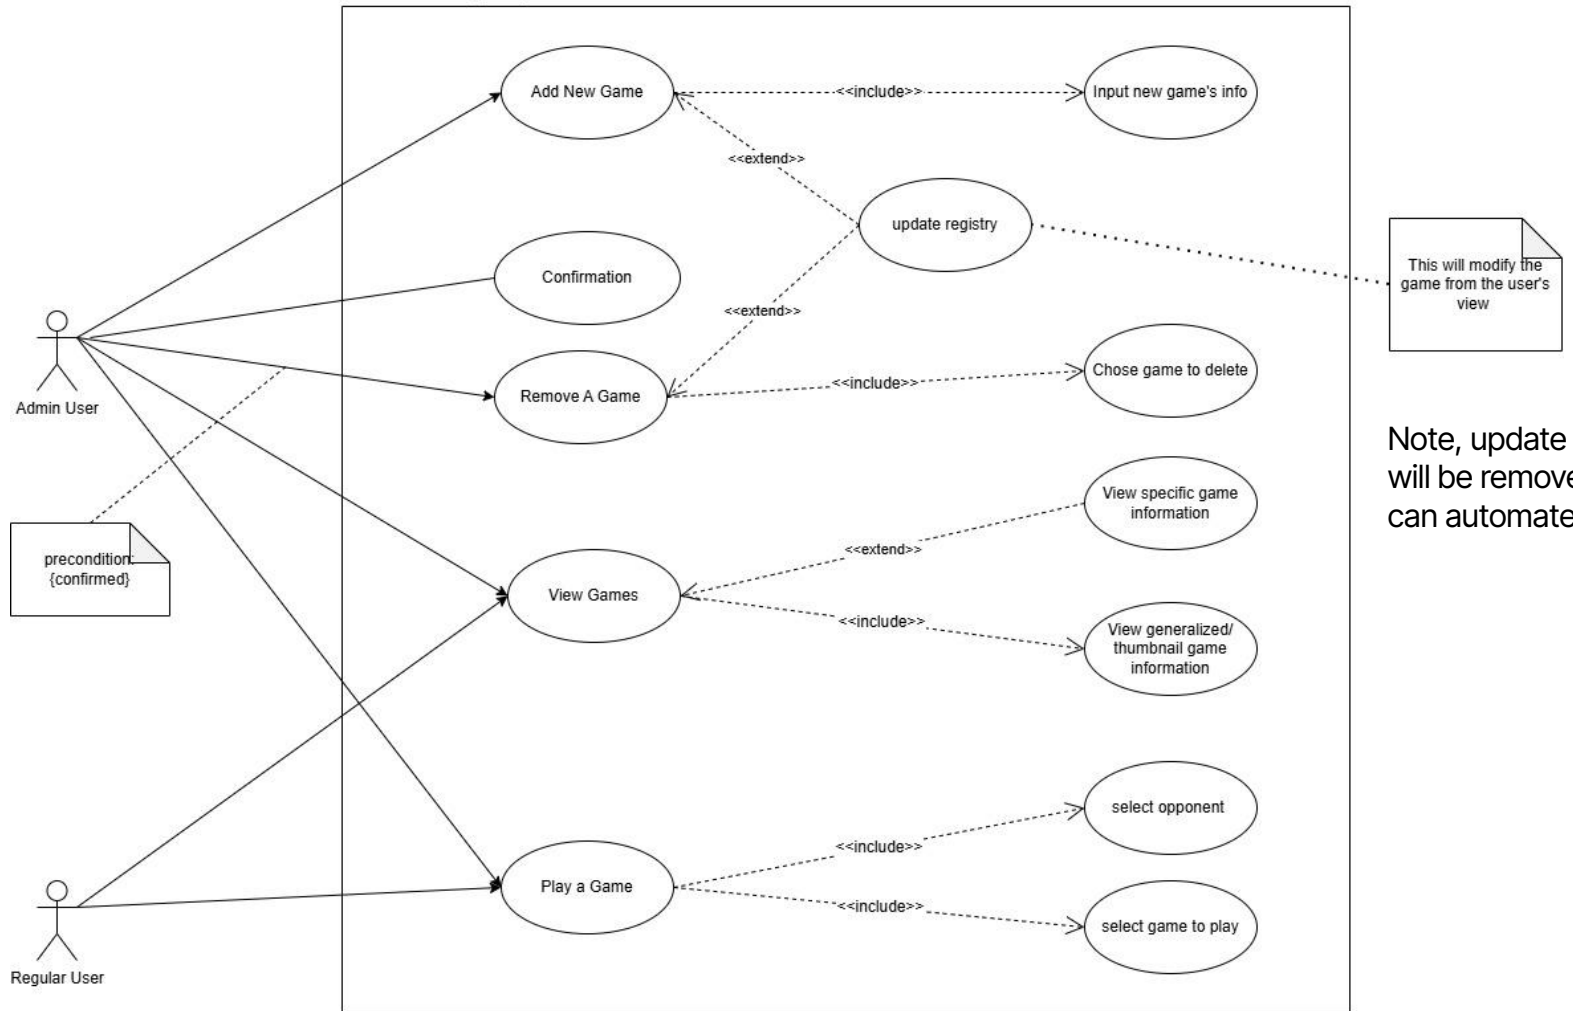

02

Use-Case Diagram

Game Registry

Admin Use Cases

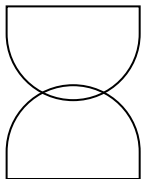

Add Game

- Prompted to enter new game info

Remove Game

- Will ask for confirmation
- Ask for what game (title or ID)

Regular Use Cases

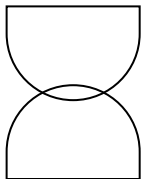

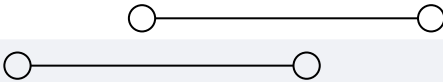

View Game

- A list of games
- Extends to allow viewing for specific game info

Play Game

- Will select what game and opponent
- Press play button

03

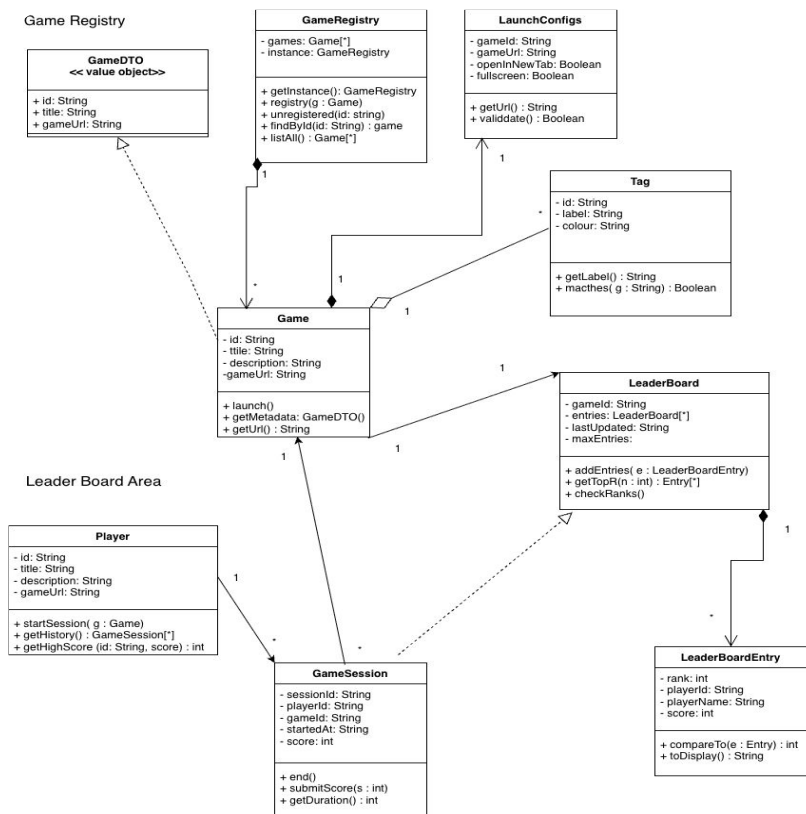

Structure Diagram

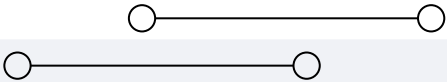

Game Registry

Design Choices

- The singleton class GameRegistry which determines there will only be one single source of truth.
- Composite was used wherever the child object has no independent existence, like how the game owns LaunchConfig.
- Aggregation, was used for tag because they are shared across all games, like parts of a game.
- GameDTO was created to avoid the long queries from database to front end, but it also specifically created to avoid exposing all the game objects across the system.

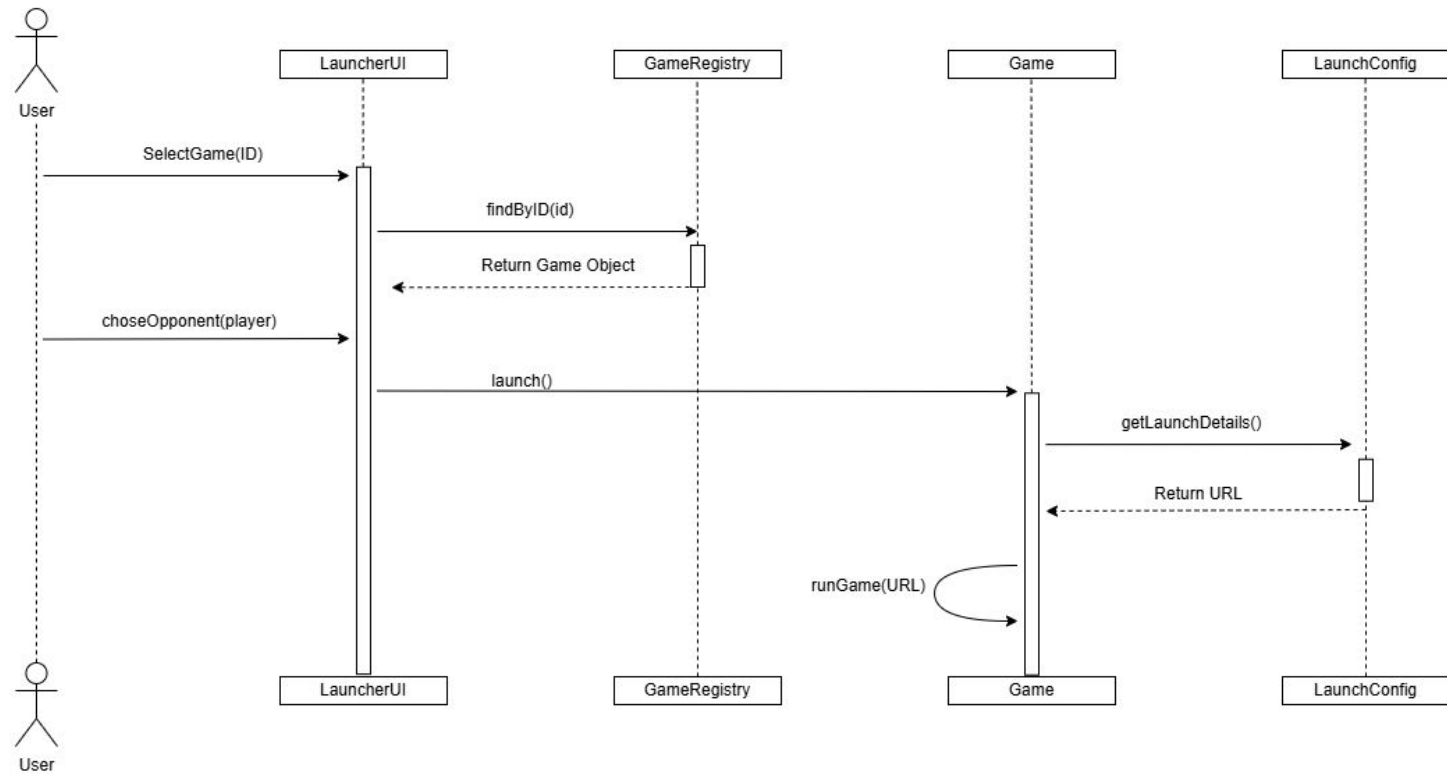

✦ 04 ✦

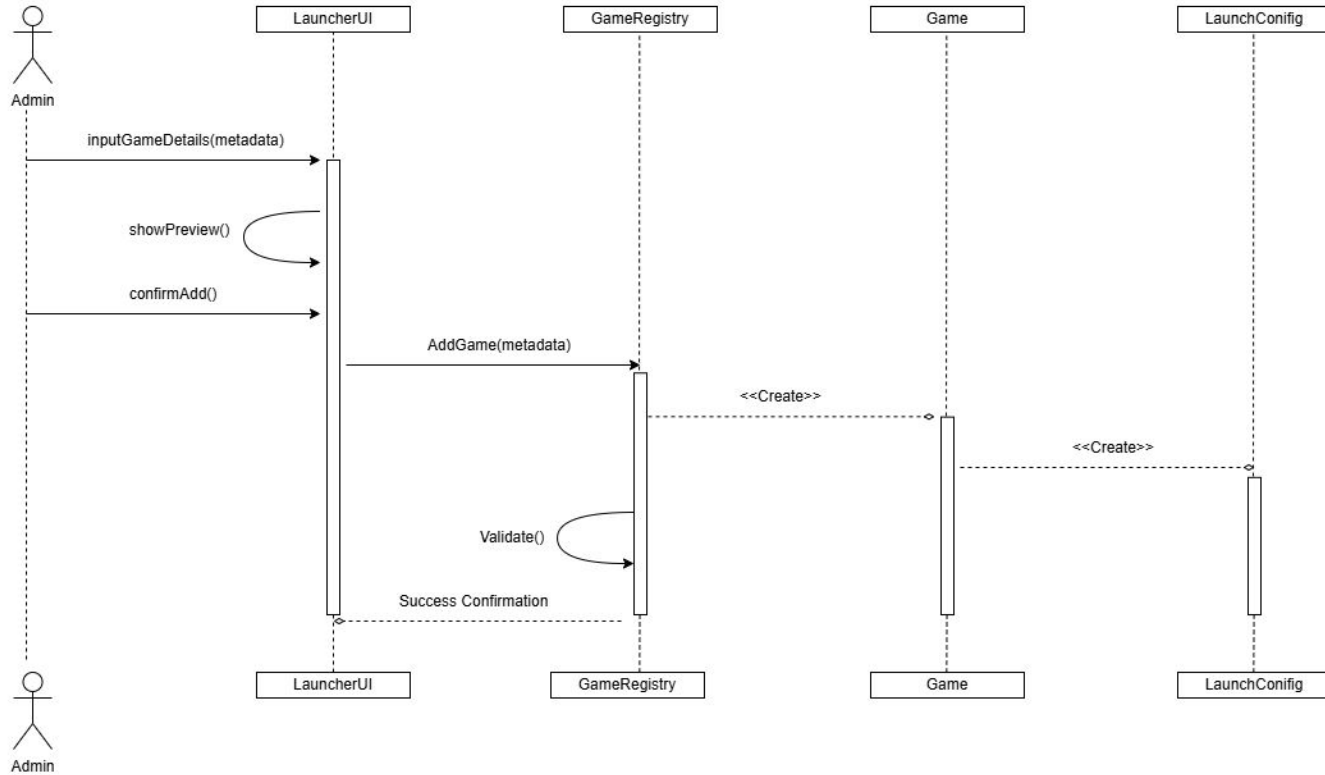

Sequence Diagram

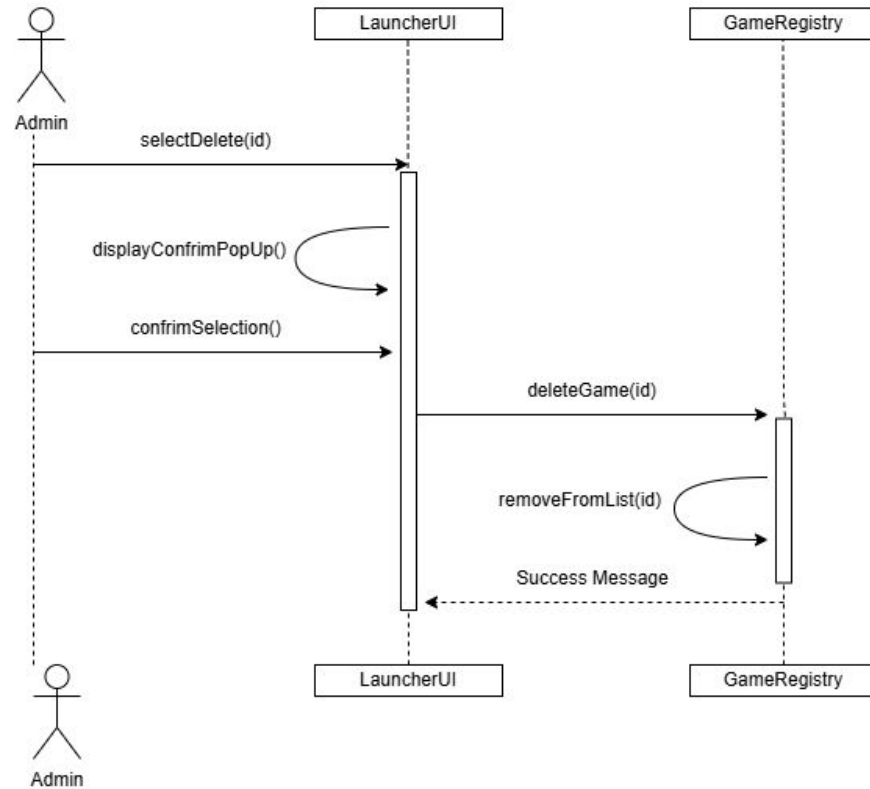

Sequence - Play a Game

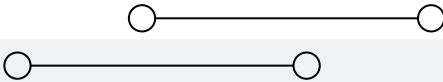

Sequence - Add A Game

Sequence - Delete A Game

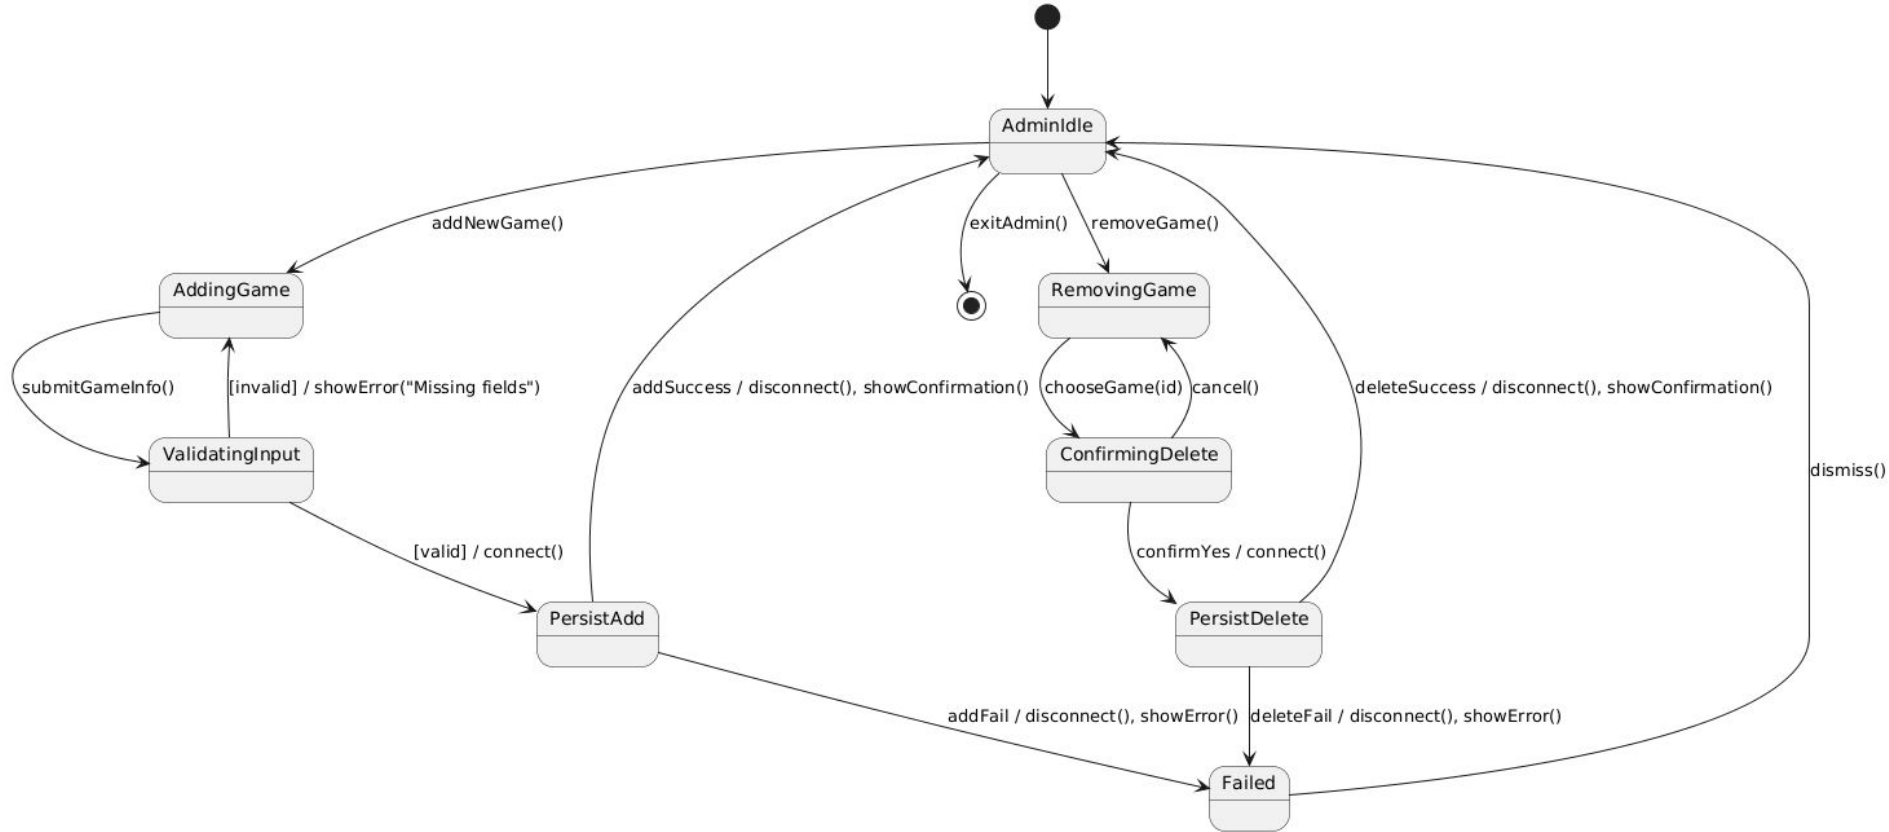

05

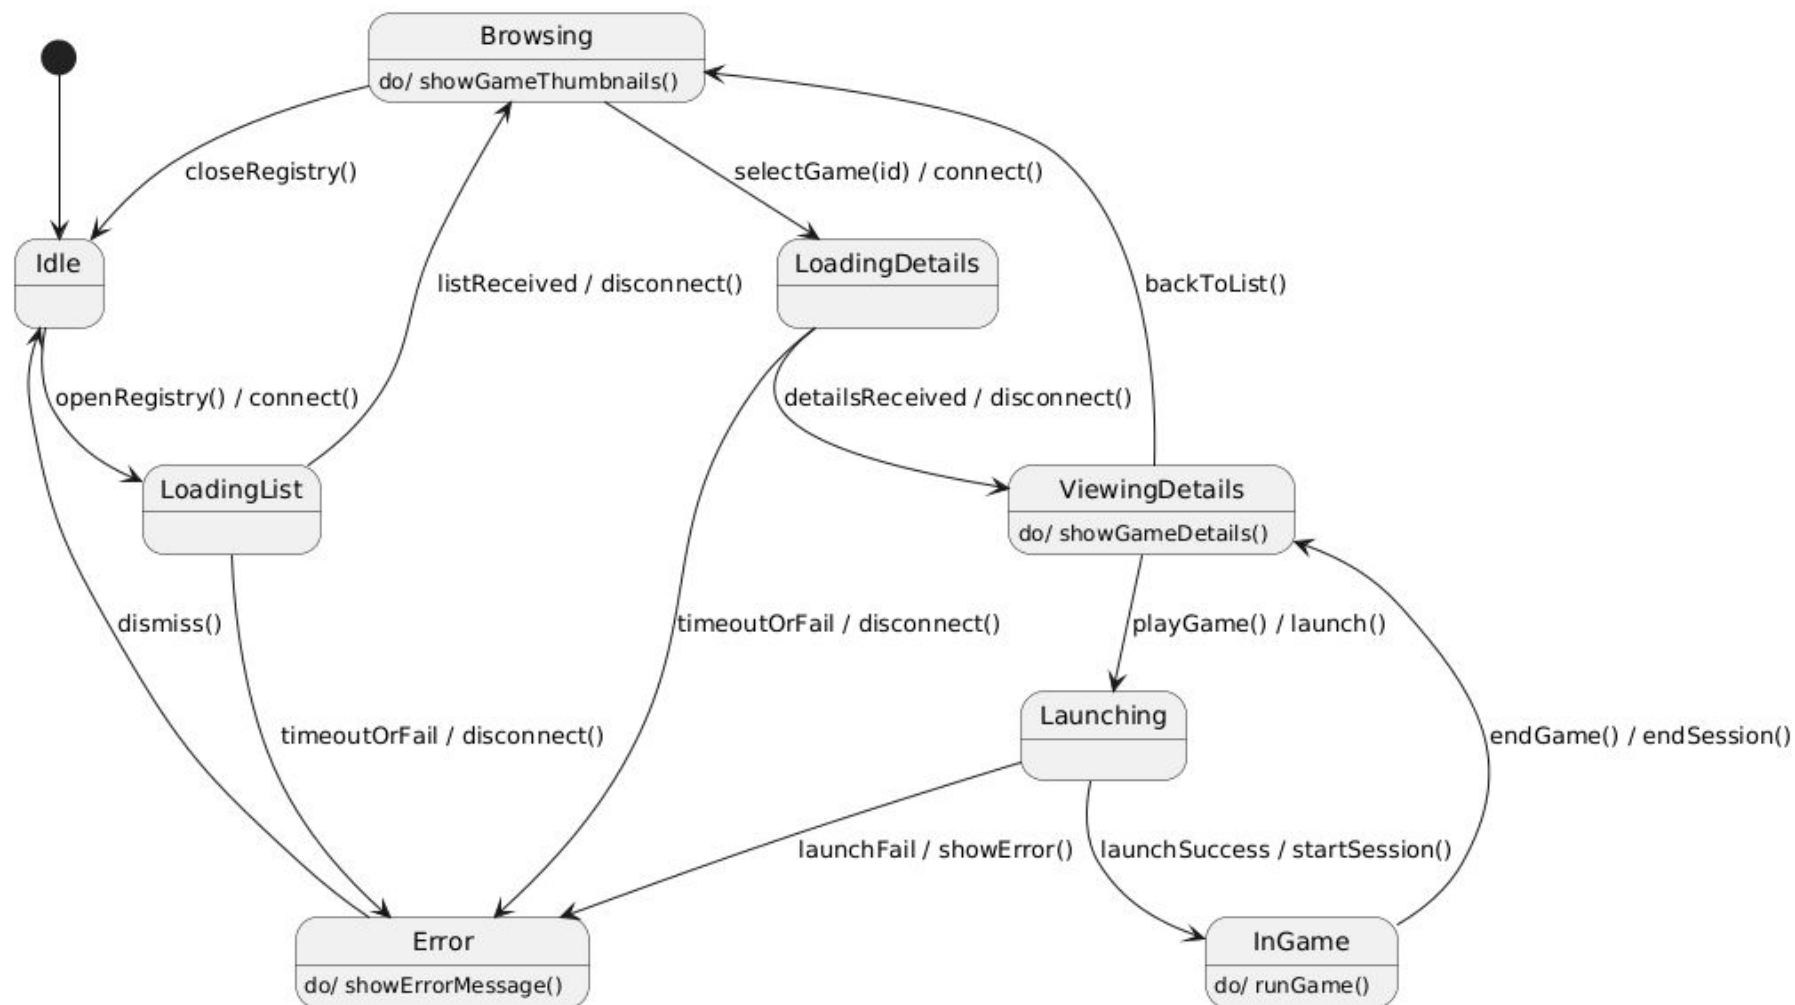

State Machine Diagrams

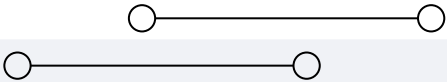

Game Registry: Admin Add/Remove State Machine

Game Registry: Browse & Play State Machine

✦ 06 ✦

Moving Forward

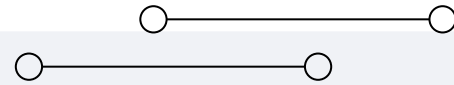

Foreseeable Challenges

**Setting boundaries
with the games, so we
can make the UI**

**Understanding the
limits of javafx,
aesthetically, and
functionally**

**Coordinating with,
and designing every
team's UI**

**Time constraints for
making and finishing
the UI for the games,
and menus**

A Proposal

- Combined aspects from other subteams
- Is it doable?
- Any changes?
